Reconfiguration

1. Switch to the develop branch and pull the latest code:

```
(Before doing this, if you have uncommitted local changes, remember to git add and git commit
first before switching to develop and pulling)
git checkout develop
git pull origin develop
```

2. Switch back to your own branch and merge the latest develop:

```
git checkout your-branch-name
git merge develop
```

3. (Skip this step if there are no latest local changes) Manually handle possible conflicts:

```
git add .
git commit -m "..."
```

4. Enter the docs folder and reinstall dependencies: (There used to be a package.json outside of docs, which has been deleted. Configuration should now be done inside docs)

```
cd docs

(For Mac, use the following commands:)
rm -rf node_modules package-lock.json
npm install
-----------------------------------------
(For Windows, use the following commands in PowerShell:)
Remove-Item -Recurse -Force node_modules
Remove-Item -Force package-lock.json
npm install
```

5. Run the file again. If there are no errors and the webpage opens normally, it's successful. (Also in the docs folder)

```
npm run dev
```
